Background & Objectives

Learn the two ways to "loop" in ruby:

- With a for loop
- With a while loop

Specs

- Write a method in ruby that computes the sum of the integers between a min value and a max value (min and max included).
- If the min value is greather than the max value, it should return -1
- You should at least implement the two simple versions, using for..end and while..end structures.
- Stick with for and while loops even though you may find other solutions searching online.

Further suggestions & resources

- ruby loops
- In Ruby, using an each iterator is considered more idiomatic than a for loop when you want to iterate through a collection. We use that later.

Key learning points

What's the difference between using a while..end and for..end structures?
